

Healthcare Platform Product Roadmap

Developer-ready scope for a multi-clinic website builder,
appointment system, patient CRM and clinic operations platform

VERSION 1.0 | SEPTEMBER 2026

Product principle

Powerful enough for clinics, simple enough for a doctor or receptionist to use without training.

CONFIRMED OUT OF SCOPE

- No online payment gateway.
- No WhatsApp integration.
- No email or SMS integration.
- No full hospital-grade electronic medical record in the first release.

1 Product Definition

Short definition. A multi-tenant healthcare platform that enables a doctor or clinic to create a premium website, publish custom services, accept appointment requests, manage schedules, maintain a patient CRM, organize follow-ups and run daily clinic operations from one simple dashboard.

The platform is not limited to dentists. It must support independent doctors, specialists and small multi-doctor clinics across different medical specialties.

Primary outcomes

- A doctor can launch a polished website without a developer.
- A patient can understand services and request an appointment quickly on mobile.
- Reception staff can operate the clinic from one daily dashboard.
- Clinic data remains isolated, searchable and controlled by permission.
- The product can grow from one doctor to multiple doctors and branches without rebuilding its foundation.

Product areas

Area	Primary user	Purpose
Public website	Patient	Discover the clinic, doctors and services; request an appointment.
Patient access	Patient	Use a secure booking-management link or OTP portal in a later phase.
Clinic dashboard	Doctor and staff	Manage website, services, appointments, patients and follow-ups.
Platform administration	Platform team	Manage clinics, plans, templates, limits, support and system health.

2 Scope and Product Boundaries

The first commercial product must prioritize simplicity, visual quality and reliable clinic operations. It should not become an oversized hospital system.

Included in the core product

- Premium clinic website builder with controlled design customization.
- Custom doctor profiles, services, pricing display and clinic information.
- Appointment requests, availability, approvals, rescheduling and cancellation.
- Daily reception dashboard, calendar, patient queue and appointment statuses.
- Basic patient CRM, internal notes, tags, files and appointment history.
- Manual follow-up tasks and in-dashboard reminders.
- Role-based access, audit logging, backups and tenant separation.
- Platform super-admin, clinic onboarding and subscription/feature controls.

Explicitly excluded

- Online payments, deposits, refunds, invoices and payment reconciliation.
- WhatsApp, email and SMS sending or automation.
- Insurance claims and insurer integrations.
- AI diagnosis or automated clinical decisions.
- Full electronic medical records, pharmacy, laboratory or hospital workflows.
- Native Android and iOS applications in the initial release.

Notification approach without external messaging

All operational alerts appear inside the clinic dashboard through notification badges, due-task lists, calendar indicators and optional browser notifications. Patient confirmations appear immediately on screen and can be viewed through a secure booking reference page. Staff can manually call or message patients outside the system when required.

3 Users and Permissions

Role	Core access	Restricted from
Clinic owner	All clinic settings, users, website, reports and records	Other clinics and platform controls
Doctor	Own schedule, assigned patients, consultation notes and follow-ups	Subscription and unrelated restricted records
Receptionist	Appointments, check-in, queue and basic patient information	Private clinical notes and system administration
Clinic manager	Operations, services, doctors, staff and reports	Platform-wide administration
Website editor	Website pages, media, services display and SEO	Appointments, patients and clinical data
Platform super-admin	Clinic lifecycle, plans, templates and system health	Routine access to clinical content

Permission requirements

- Permissions must be enforced by the backend, not only hidden in the interface.
- Every user belongs to a clinic tenant and may optionally be limited to a branch.
- Sensitive record views, edits, downloads and deletions must be audited.
- Support access by the platform team must be time-limited and recorded.
- Owners can deactivate staff access immediately.

4 Clinic Onboarding

The onboarding wizard should create a useful first version of the clinic website and dashboard in less than 15 minutes.

Step	Information	System output
1	Clinic or doctor name, specialty and account owner	Clinic tenant and starter configuration
2	Logo, profile image and preferred colors	Initial brand theme
3	Address, phone, map link and opening hours	Contact and location sections
4	Doctors and qualifications	Doctor profile cards
5	Services, duration and displayed price	Service pages and booking options
6	Template and homepage sections	Generated website preview
7	Subdomain selection	Draft public URL
8	Review and publish	Live website

Onboarding rules

- Allow skipping non-essential steps and returning later.
- Save progress automatically.
- Use specialty presets only as suggestions; every field remains editable.
- Show a completeness checklist after onboarding.
- Never publish until the owner confirms the preview.

5 Premium Website Builder

The website builder should offer strong design quality through controlled choices. It should not be a free-form canvas that allows users to create broken layouts.

Brand controls

- Logo, favicon, primary color, accent color and background palette.
- Curated font pairings instead of unrestricted font selection.
- Button style, corner radius, card style and section spacing presets.
- Header, navigation and footer variants.
- Desktop and mobile preview.
- Draft, preview and publish workflow with version history.

Reusable sections

Section group	Available blocks
Conversion	Hero, appointment CTA, quick-contact bar, appointment steps
Trust	Doctor profile, qualifications, clinic statistics, reviews, gallery
Information	Services, FAQs, opening hours, location, insurance note
Content	About, article listing, educational content, announcements
Legal	Privacy, terms, cancellation policy and medical disclaimer

Section behavior

- Show, hide, reorder and duplicate supported sections.
- Edit content and images directly from a clear side panel.
- Offer two or three approved layouts per section.
- Prevent unreadable color combinations through automatic contrast checks.
- Preserve mobile responsiveness automatically.

6 Services and Doctor Profiles

Services are created by the clinic and displayed automatically on the public website and booking journey.

Service field	Purpose
Name and category	Public organization and search
Short and full description	Cards and detail pages
Image	Public service visual
Price display	Exact price, range, starting price or contact clinic
Duration and buffer	Availability calculation
Assigned doctors and branches	Booking eligibility
Approval mode	Instant confirmation or staff approval
Preparation instructions	Displayed after booking
Status and visibility	Active, hidden or archived

Doctor profile fields

- Name, photo, qualifications, specialty and biography.
- Registration or licence information with a verification status.
- Languages, experience, locations and services.
- Consultation duration and weekly availability.
- Public profile visibility and next available slot.

7 Appointment System

The appointment engine must be owned by the platform database. External scheduling tools may be evaluated later, but the core system cannot depend on them.

Patient journey

Step	Patient action	System behavior
1	Choose service or reason for visit	Shows eligible doctors and locations
2	Choose doctor or any available	Filters slots
3	Choose date and time	Temporarily holds slot
4	Enter patient information	Checks for an existing patient
5	Answer clinic-defined questions	Validates required fields
6	Submit request	Creates appointment and reference number
7	View confirmation screen	Shows status, clinic details and booking-management link

Availability rules

- Working hours, breaks, leave, blocked slots and public holidays.
- Service duration, preparation buffer and cleanup buffer.
- Doctor, branch, room or resource availability where configured.
- Minimum notice, booking horizon and same-day booking policy.
- Maximum appointments per day and conflict prevention.
- Instant confirmation or clinic approval by service.

8 Appointment Lifecycle and Calendar

Status	Meaning	Primary action
Requested	Patient submitted a request	Approve or reject
Confirmed	Slot is accepted	Prepare for visit
Arrived	Patient checked in	Add to queue
Waiting	Patient is ready	Doctor starts consultation
In consultation	Visit is active	Complete or schedule follow-up
Completed	Visit finished	Close record or create follow-up
Rescheduled	Time changed	Retain history
Cancelled	Booking cancelled	Record reason
No-show	Patient did not attend	Create recovery task

Calendar requirements

- Day, week, month, doctor, branch and list views.
- Color-coded status with a visible legend.
- Filters for doctor, service, branch and status.
- Create, move and edit appointments with conflict validation.
- Block time and manage leave.
- Retain an audit trail when time, doctor or status changes.
- Provide printable daily schedule only if requested during discovery.

9 Daily Clinic Dashboard

The home dashboard should be action-oriented. Doctors and staff should immediately see what requires attention.

Area	Information
Summary row	Today appointments, waiting patients, pending approvals, follow-ups due and no-shows
Live queue	Arrived and waiting patients ordered by check-in time
Schedule	Current, next and remaining appointments
Tasks	Pending approvals, overdue follow-ups and incomplete records
Recent activity	Bookings, changes, cancellations and staff actions
Quick actions	Add patient, add appointment, block time, check in and create follow-up

Usability rules

- Use plain language and visible primary actions.
- Avoid excessive graphs on the landing dashboard.
- Display urgent and overdue items before general statistics.
- Make all daily actions usable on a tablet.
- Keep common tasks within two or three interactions.

10 Patient CRM

Patient area	Required information
Identity	Name, phone, date of birth, gender when relevant and internal ID
Contact	Address, alternate number and emergency contact
Clinic relationship	First visit, last visit, preferred doctor and branch
Appointments	Upcoming, completed, cancelled and no-show history
Internal organization	Tags, status, assigned staff and internal notes
Documents	Consent files, reports or images with restricted access
Follow-ups	Due, overdue, completed and outcome
Activity	Record of major profile and appointment changes

CRM capabilities

- Search by name, phone number or patient ID.
- Detect likely duplicates before creating a patient.
- Filter by doctor, service, tag, visit status or follow-up state.
- Archive rather than silently delete records.
- Export permitted clinic data through an owner-controlled process.
- Keep reception notes separate from private doctor notes.

11 Follow-ups and Internal Notifications

Follow-ups remain manual or dashboard-driven in the initial product. The system creates tasks and alerts staff, but it does not send external messages.

Follow-up field	Example
Patient	Patient record link
Reason	Post-treatment check, next session or routine recall
Assigned user	Doctor or receptionist
Due date	Specific date and optional time
Priority	Normal, important or urgent
Status	Due, overdue, contacted, booked, completed or closed
Outcome note	Result of the call or external contact

Internal notification examples

- New appointment request.
- Appointment awaiting approval.
- Patient arrived.
- Follow-up due or overdue.
- Doctor schedule conflict.
- Incomplete appointment record.
- New staff invitation or permission change.
- Website draft waiting to be published.

12 Platform Administration

The super-admin must manage the SaaS platform without entering routine clinical workflows.

Clinic management

- Create, approve, suspend and reactivate clinic accounts.
- View plan, user count, doctor count, branch count and storage usage.
- Manage subdomains and custom-domain status.
- Enable feature flags and plan limits.
- Open time-limited support access with a reason and audit record.
- Review onboarding progress and account health.

Platform configuration

- Website templates and reusable sections.
- Specialty presets and suggested service structures.
- Subscription plans and feature limits without payment processing.
- System announcements and maintenance messages.
- Support tickets, error logs, audit events and service status.
- Platform-level usage analytics that exclude clinical content.

13 Data Model

Every clinic-owned record must include a tenant identifier. Tenant isolation must be validated in automated tests and database policies.

Entity	Important relationships
Clinic tenant	Owns branches, users, website, patients and appointments
Branch	Belongs to clinic; has hours, resources and doctors
User and role	Belongs to clinic; receives explicit permissions
Doctor profile	Links to user, services, branches and availability
Service	Links to doctors, branches, duration and public pages
Patient	Belongs to clinic; links to appointments and follow-ups
Appointment	Links patient, doctor, service, branch, slot and status
Follow-up task	Links patient, appointment, owner, due date and outcome
Website	Links theme, pages, sections, navigation and domain
Audit event	Records actor, action, record, time and relevant metadata

Critical rules

- Never use a phone number as the primary database key.
- Use immutable internal IDs and retain change history.
- Store uploads privately and serve them through expiring authorized links.
- Use soft deletion or archival for operational records.
- Separate public website content from private clinic information.

14 Security and Reliability

Security is part of the product scope, not a final launch task.

Area	Minimum requirement
Authentication	Secure sessions, strong password rules and MFA for owners/admins
Authorization	Backend permission checks and strict tenant isolation
Audit	Log sensitive reads, edits, exports and permission changes
Encryption	HTTPS in transit and encrypted databases/backups at rest
Uploads	Type validation, malware scanning and private access
Backups	Automated encrypted backups and tested restoration
Abuse protection	Rate limits, OTP limits if enabled and bot protection
Operations	Monitoring, error tracking and incident response
Privacy	Consent records, retention rules, export and deletion workflow

Launch security gate

- No cross-tenant access in automated penetration tests.
- Permission matrix passes for every role.
- Backup restoration succeeds in staging.
- Sensitive documents cannot be accessed through copied expired URLs.
- Production secrets are not stored in source code.
- All administrative actions are auditable.

15 Design and Experience Direction

The product must look premium, calm and trustworthy while remaining extremely easy to use. The visual style should feel modern and healthcare-specific, not like a generic admin template.

Design principles

- Mobile-first public websites and tablet-friendly clinic operations.
- Generous spacing, clean typography and strong hierarchy.
- One obvious primary action per screen.
- Human-readable statuses and confirmation messages.
- Progressive disclosure: advanced controls appear only when needed.
- Accessible color contrast, keyboard navigation and clear focus states.
- Skeleton states, empty states, validation and recovery guidance.
- Consistent cards, forms, tables, drawers and modal behavior.

Recommended interface style

Surface	Direction
Public website	Editorial healthcare layout, large authentic imagery, strong doctor identity, restrained motion
Dashboard	Light neutral background, compact navigation, clear status colors, action-focused cards
Forms	Single-column on mobile, descriptive labels, inline validation, saved progress
Calendar	Readable density, status legend, quick drawer for appointment actions
Website editor	Live preview with a simple editing panel and safe design presets

16 Delivery Roadmap

Phase	Estimated duration	Deliverables
1 Product and UX foundation	2-3 weeks	Final flows, permission matrix, data model, design system and clickable prototype
2 SaaS foundation	3-4 weeks	Authentication, tenants, roles, clinic setup and super-admin base
3 Website builder	5-7 weeks	Templates, sections, brand controls, preview, publishing and domains
4 Booking engine	5-7 weeks	Availability, booking journey, calendar, statuses and conflict logic
5 Patient CRM	4-5 weeks	Profiles, history, search, tags, notes, files and duplicate controls
6 Clinic operations	3-4 weeks	Daily dashboard, queue, follow-ups and internal notifications
7 Administration	3-4 weeks	Plans, feature limits, support access, templates and monitoring
8 QA and pilot	3-4 weeks	Security, accessibility, performance, pilot onboarding and launch

Realistic delivery: approximately 5-7 months for a strong commercial release. A tightly controlled MVP can be launched in approximately 3-4 months by limiting templates, roles, reporting and branch functionality.

17 MVP Release Definition

The MVP is ready for sale when a clinic can onboard, publish a website and run its appointment workflow without developer intervention.

MVP includes

- Clinic onboarding and specialty selection.
- Three premium website templates.
- Controlled branding and section editor.
- Custom services and doctor profiles.
- Responsive clinic website and subdomain.
- Appointment request and approval workflow.
- Doctor availability and conflict prevention.
- Daily dashboard and appointment calendar.
- Patient CRM with notes, tags and history.
- Manual follow-up tasks and internal alerts.
- Owner, doctor and receptionist roles.
- Platform super-admin and plan limits.
- Audit logs, backups and core security controls.

MVP release acceptance

- A non-technical clinic can publish a complete website in under 30 minutes.
- A mobile patient can complete a booking request in under three minutes.
- Staff can manage the full appointment lifecycle without spreadsheets.
- Cross-clinic data access is impossible under tested scenarios.
- Core pages meet accessibility and performance targets.
- No screen depends on payment or external messaging integrations.

18 Developer Acceptance Criteria

Feature	Acceptance condition
Tenant isolation	A user cannot query, view or mutate another clinic's records through UI or API.
Website publishing	Draft changes do not affect the live site until publish succeeds.
Responsive design	Public pages work from 320 px mobile width through desktop.
Availability	Unavailable, blocked or conflicting slots cannot be booked.
Appointment history	Status and schedule changes retain actor and timestamp.
Permissions	Restricted actions fail at API level for unauthorized roles.
Patient search	Name, phone and patient ID return scoped clinic results quickly.
Follow-ups	Due and overdue tasks appear reliably on the assigned user dashboard.
Files	Private files require authorization and use expiring access links.
Backups	A documented restoration test successfully rebuilds staging data.
Accessibility	Core flows support keyboard operation, labels and adequate contrast.
Performance	Public pages target fast mobile loading and optimized media.

19 Product Success Measures

Category	Initial measure
Onboarding	Time to first published website; setup completion rate
Website	Mobile performance; appointment CTA conversion
Booking	Booking completion, approval time, cancellations and no-shows
Operations	Time to check in; overdue follow-ups; schedule conflicts
Retention	Active clinics, weekly active staff and clinic renewal
Usability	Task completion rate, support requests and user satisfaction
Reliability	Uptime, error rate, backup success and security incidents

Final product vision

A doctor signs up, selects a specialty and premium template, adds branding, doctors, services and timings, then publishes a complete clinic website. Patients request appointments through the website. The clinic manages approvals, schedules, the live patient queue, patient history and follow-ups through one clear dashboard.

The product should feel simple on the surface and disciplined underneath. Visual quality earns trust; reliable workflows retain clinics; secure architecture allows the platform to scale.
